SUMMARY

Computer Engineering graduate specializing in embedded systems and full-stack development, with hands-on experience building local LLM tools, web applications, C/C++ utilities, and ESP32-based automation projects. Comfortable across the stack, with a primary strength in C programming and a strong interest in AI, computer vision, and system automation.

CORE SKILLS

Languages: C, C++, C#, Python, PHP, JavaScript, TypeScript, HTML/CSS, SQL/MySQL

Web & Backend: React, Next.js, Node.js, Django, PHP, MySQL, XAMPP

AI / Tools: Ollama, vLLM, prompt engineering, local model workflows

Embedded / Systems: ESP32-CAM, IoT concepts, file handling, debugging, testing

PROJECTS

AI File Analyzer (LLM Integration) — *Personal Project*

- Built a full-stack web application that lets users upload files for AI-assisted analysis using locally hosted LLMs.
- Implemented a backend document pipeline to extract and preprocess text before inference.
- Designed prompt workflows for structured summarization and response generation.
- Integrated file ingestion, model inference, and response rendering into a working prototype.

Localized AI and Fine-Tuning — *Personal Project*

- Deployed local LLM inference pipelines using vLLM and Ollama.
- Configured model-serving environments and experimented with batching and latency tuning.
- Implemented prompt optimization and fine-tuning workflows to improve response quality.
- Connected the models to a lightweight local application for real-time query handling.

Hawak Kamay Scholarship Portal — *Student Web Developer | Software Design course | 2-person team project*

- Co-developed a full-stack scholarship portal for students, instructors, and administrators.
- Built responsive interfaces with HTML, CSS, and JavaScript.
- Implemented PHP backend logic and a relational MySQL database, tested locally on XAMPP.
- Added schedule management, hour tracking, messaging, and role-based portals.
- Collaborated with classmates to refine requirements, UI flow, and functional testing.

Automated Piggery Cleaning System with Disinfectant Sprayer — *Design Project / Thesis*

- Designed and developed an automated cleaning system for piggery environments.
- Integrated ESP32-CAM for monitoring and control.
- Implemented local network access for remote activation and system management.
- Applied IoT concepts to support automation and real-time operation.

Payslip Generator System — *Student Developer | Data Structures and Algorithms course*

- Built a console-based payslip generator in C++ using file handling and basic data structures.
- Created functions to compute payslip values and generate formatted text files.
- Implemented menu-driven record management for open, edit, delete, and update actions.
- Tested calculations, file operations, and error handling for reliability.

EDUCATION

Bachelor of Science in Computer Engineering | *August 2022 - May 2026*

Phinma - Cagayan de Oro College (Carmen Campus), Cagayan de Oro City

WORK STYLE

Analytical, detail-oriented, and comfortable working independently or in a team on collaborative software and hardware projects.
